

In relation to the planned website, the basic XHTML tags from W3Schools can be applied to structure and format the content. The <html> tag will enclose the entire document, while the <head> tag will contain meta information and the <title> tag for the webpage title. The <body> tag will enclose the main content, with headings using <h1> to <h6> tags to indicate different levels of importance. Paragraphs can be wrapped with <p> tags, and line breaks can be achieved with
 tags. To emphasize text, the or tags can be used for bold or italic formatting respectively. For lists, and tags can be used for unordered lists, while and tags can be used for ordered lists. To add links, the <a> tag is used, with the href attribute specifying the URL. Lastly, images can be included with the tag, using the src attribute to specify the image source. These basic XHTML tags will help structure and format the content for the planned website.
